

Practical Software and Systems Measurement

Practical Software and Systems Measurement

A foundation for objective project management

*Safety Workshop
PSM Technical Working Group*

Paul Caseley, Tony Powell

Practical Software and Systems Measurement

Next Steps/Action Items

Task 1, Develop White Paper - by July 2003:

- ***Literature search***
Draft, currently being reviewed
- ***Questionnaire supported by site visits.***
Draft, but need to identify suitable distribution medium
- ***A workshop to identify safety information needs and potential measures, by end of January 2003.***
This workshop
- ***Development of measurement specifications.***

- ***Final White Paper - Measurement and Safety***

Task 2, Conduct Field Trials - by July 2004. *Field trials to validate the recommendations in the white paper.*

Task 3, Update White Paper - by Sep 2004. *Update the white paper with lessons learned from the field trials.*

Practical Software and Systems Measurement

Presentation Overview

Safety Process Measurement

- ***What is it?***
- ***Using PSM***
- ***Research area***
- ***Example applications***
- ***Safety and Security CMMI***

Safety Workshop

Practical Software and Systems Measurement

Safety Processes, what are they?

- ***All safety activities and techniques that produce products that in turn support the Safety of the System***

Processes

Hazard Identification

Preliminary Hazard Analysis

System Hazard Analysis

Failure Integrity

Accident/Incident Investigation

Safety Management

Techniques

HAZOP, What if..

ETA, FTA ..

FMECA, FTA ..

FMET, Proof, Modelling ..

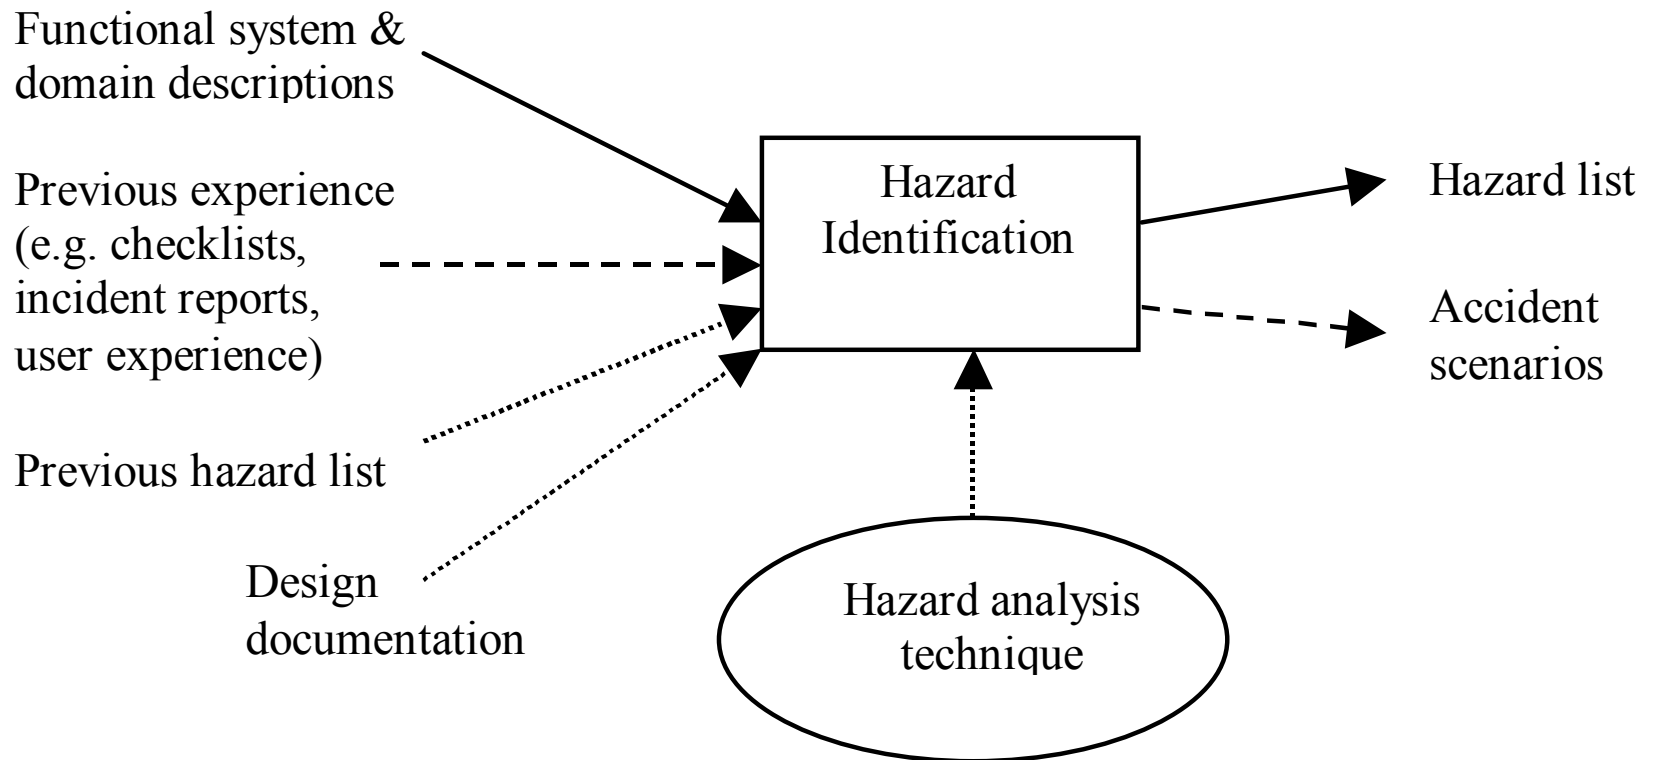

ETA, CCA ..

Hazard Logs, Plans..

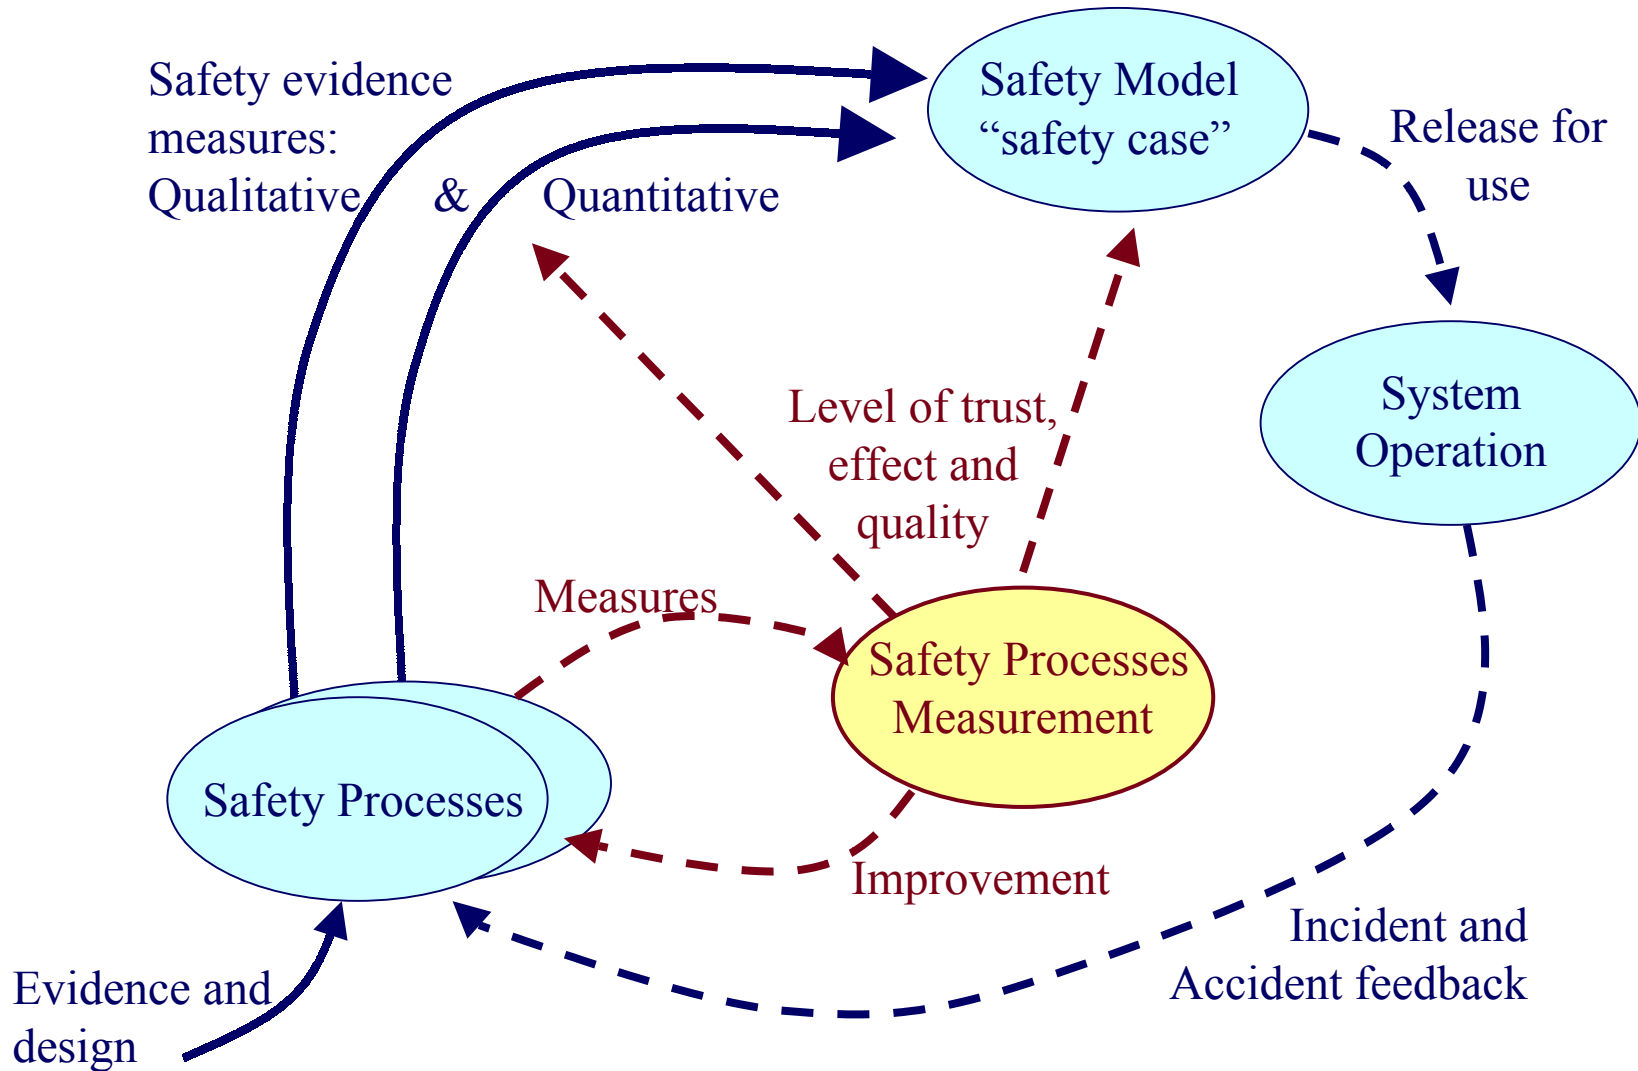

- ***Over 200 documented techniques***
- ***Safety is Estimated of between 1% and 15% of the system cost (possibly more for some super critical systems such as Nuclear)***

Practical Software and Systems Measurement

Typical Input and Output Products

Practical Software and Systems Measurement

Safety Process Measurement

Practical Software and Systems Measurement

Common Issue Area	Measurement Category	Measures	Data Items; Attributes
Product Quality	Efficiency	Utilisation	<p>Maximum capacity of resource, Maximum amount of resource established as design limit, maximum amount of resource established as performance limit, Date/time of measurement, Amount of resources used</p> <p>Resource type, Increment, State or Mode Operational Profile, Function , task or operation measured, Test sequence</p>
	Usability	Operator Errors	<p>Time period over which task was performed, Number of operators errors;</p> <p>Task identifier, Increment, User interface device, Priority, Test sequence, Category of operator errors, Operations document identifier</p>
	Dependability – Reliability	Fault Tolerance	<p>Number of single point failures, Number of identified failure modes, Number of identified failure modes with fault-tolerant design protection;</p> <p>Failure mode, Failure effect, Redundancy level, Type of Fault</p>

I-C-Ms where safety is implicated or quoted

Practical Software and Systems Measurement

Common Issue Area	Measurement Category	Measures	Data Items; Attributes
Customer Satisfaction	Customer Support	Request for Support	Number of requests, Number of reported defects; Increment, Priority (safety hazard, critical impact, minor), Type of support requested, Request mechanism, Non support resolution (request beyond support agreement), Status code (open, closed) Customer or originator of request, Activity when problem was discovered.
		Support Time	Number of requests received, Average response time, Maximum response time, Average time to resolve, Maximum time to resolve Type of maintenance required, Increment, Priority (safety hazard, critical impact, minor), Non support resolution (request beyond support agreement), Customer or originator of request, Request mechanism.

I-C-Ms where safety is implicated or quoted

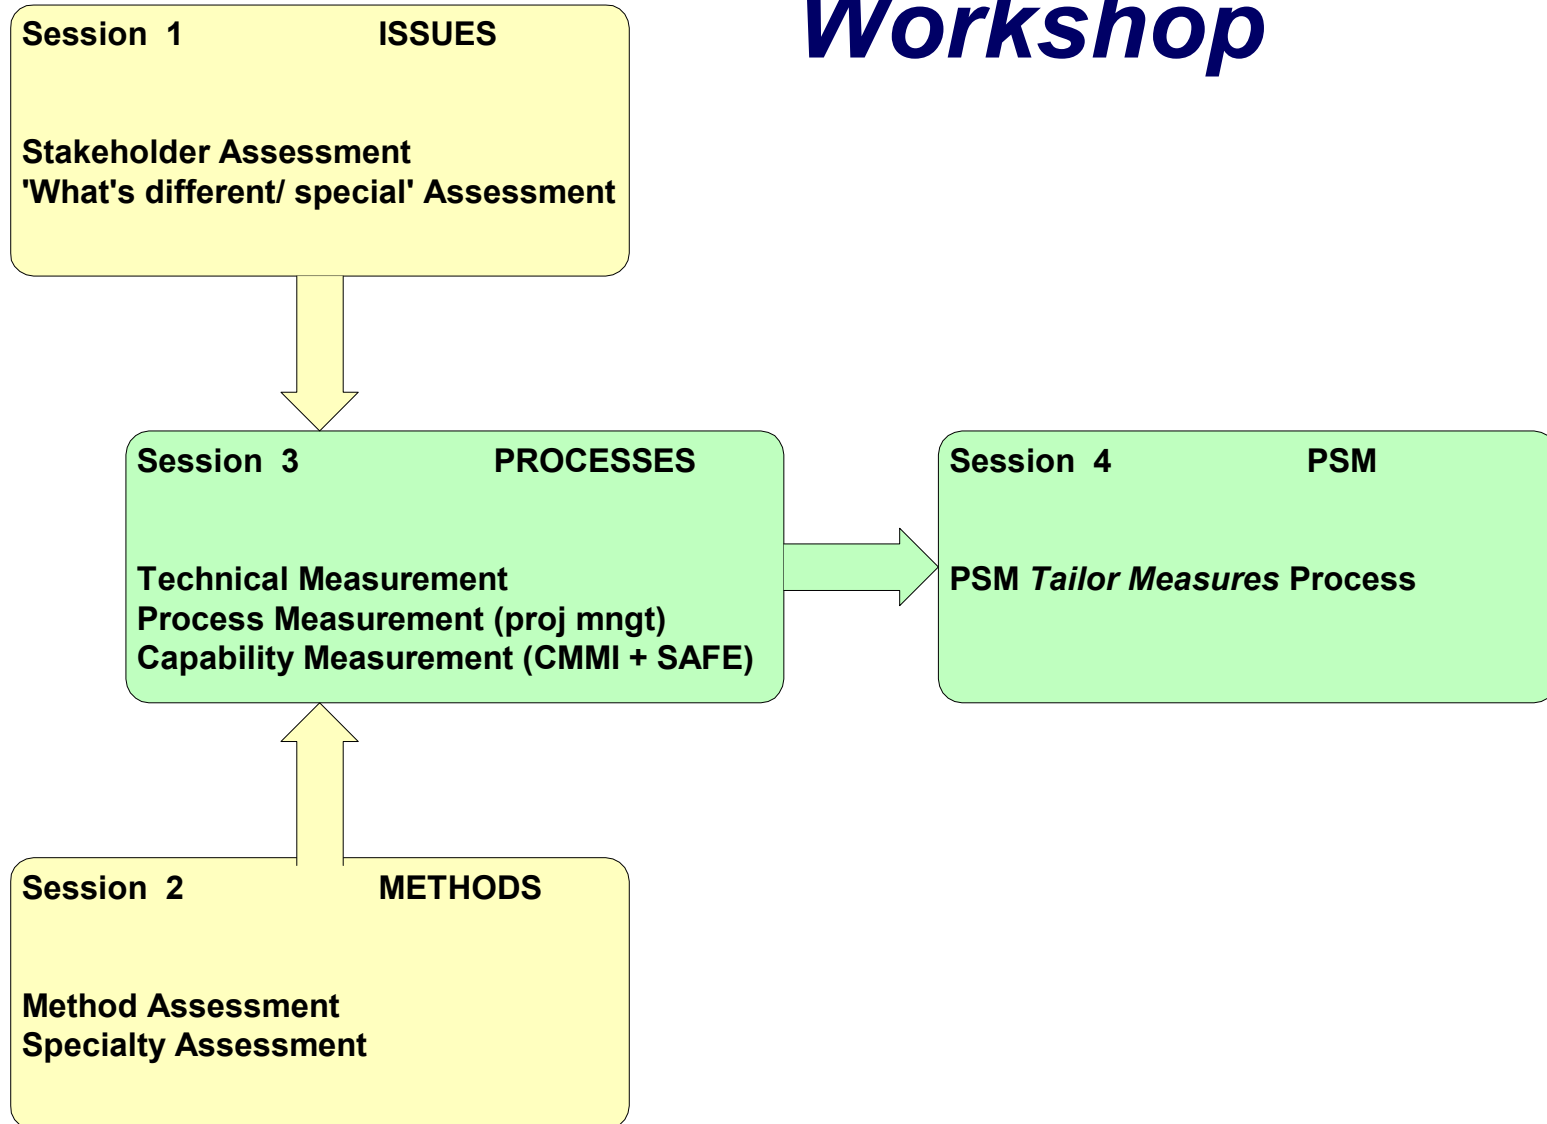

Practical Software and Systems Measurement

Using PSM to Manage Security/Safety

- ***Schedule and Progress***
 - ***Ensuring safety processes correctly influence the program***
 - ***Estimating safety impact***
- ***Resources and Cost***
 - ***Competency of personnel***
- ***Product size and capability***
 - ***New threats/hazards always add new requirements***
 - ***Unique safety products (FTA, ETA, FMECA, safety cases)***
- ***Technology Effectiveness***
 - ***Novel designs new safety issues***

Practical Software and Systems Measurement

Workshop

Practical Software and Systems Measurement

Final Session to add to PSM

<i>Schedule and Progress</i>	<i>Work Unit Progress</i>	<i>Safety Requirements Status</i>
		<i>Safety Action Item Status</i>
<i>Product Size and Stability</i>	<i>Physical Size and Stability of safety-critical systems, at different risk levels</i>	<i>Subsystems</i>
		<i>Components</i>
		<i>Interfaces</i>
		<i>Operations</i>
	<i>Functional Size and Stability of safety-critical systems, at different risk levels</i>	<i>Physical Dimensions (zones)</i>
		<i>Requirements</i>
<i>Product Quality</i>	<i>Safety</i>	<i>Modes</i>
		<i>Functions</i>
		<i>Hazards</i>
		<i>Hazard Scenarios</i>
		<i>Failure and Contributory Modes in Hazard Scenarios</i>
<i>Process Performance</i>	<i>Process Compliance</i>	<i>Coverage</i>
		<i>Single Point Failures</i>
	<i>Process Effectiveness</i>	<i>Compliance with regulatory & advisory models</i>
<i>Technology Effectiveness</i>	<i>Technology Suitability</i>	<i>Certification Data</i>
		<i>Operational safety-related 'events'</i>
<i>Regulator Satisfaction</i>	<i>Regulator Feedback</i>	<i>Safety Experience/ application</i>
		<i>Survey Results</i>
	<i>Regulator Support</i>	<i>Performance Rating</i>
		<i>Support for certification process</i>

UK Law: Measurement for ALARP

- **As Low as Reasonably Practicable (ALARP)**
 - *'Low' refers to the effectiveness of safety processes, i.e. are they making systems and software safe.*
 - *'Practicable' refers to the efficiency of safety processes, i.e. how much is enough?*

- **Understanding ALARP Strategies**
 - *We need to understand the efficiency and effectiveness of existing safety processes in order to support ALARP arguments.*
 - *For example, does a HAZOP identify all the hazards? If not how many are identified and are they the important ones? Is it only suitable for some domains?*

Practical Software and Systems Measurement

Research Directions

- ***Existing Research/Practice***
 - ***Tribble (CBA from survey)***
 - ***Soukas (empirical evaluation of hazard identification)***
 - ***Rouhianinen (checklist)***
 - ***Organisational Assessment: CASS, CMMI, TÜV, Nuclear***
 - ***Practical System and Software Measurement (PSM)***
 - ***Competency Assessment***
 - ***Bayesian Belief Networks***
- ***Directions***
 - ***CMMI, Integration Assurance Practices, +SAFE***
 - ***PSM (identification of safety attributes)***
 - ***Organic Measurement (PEL)***
- ***Measurement requirements***
 - ***Industrial measuring processes?***
 - ***Capable of fine-grained data***
 - ***Had to successfully migrate across different organisations***
 - ***Needed to carry a context of activities with the measure***

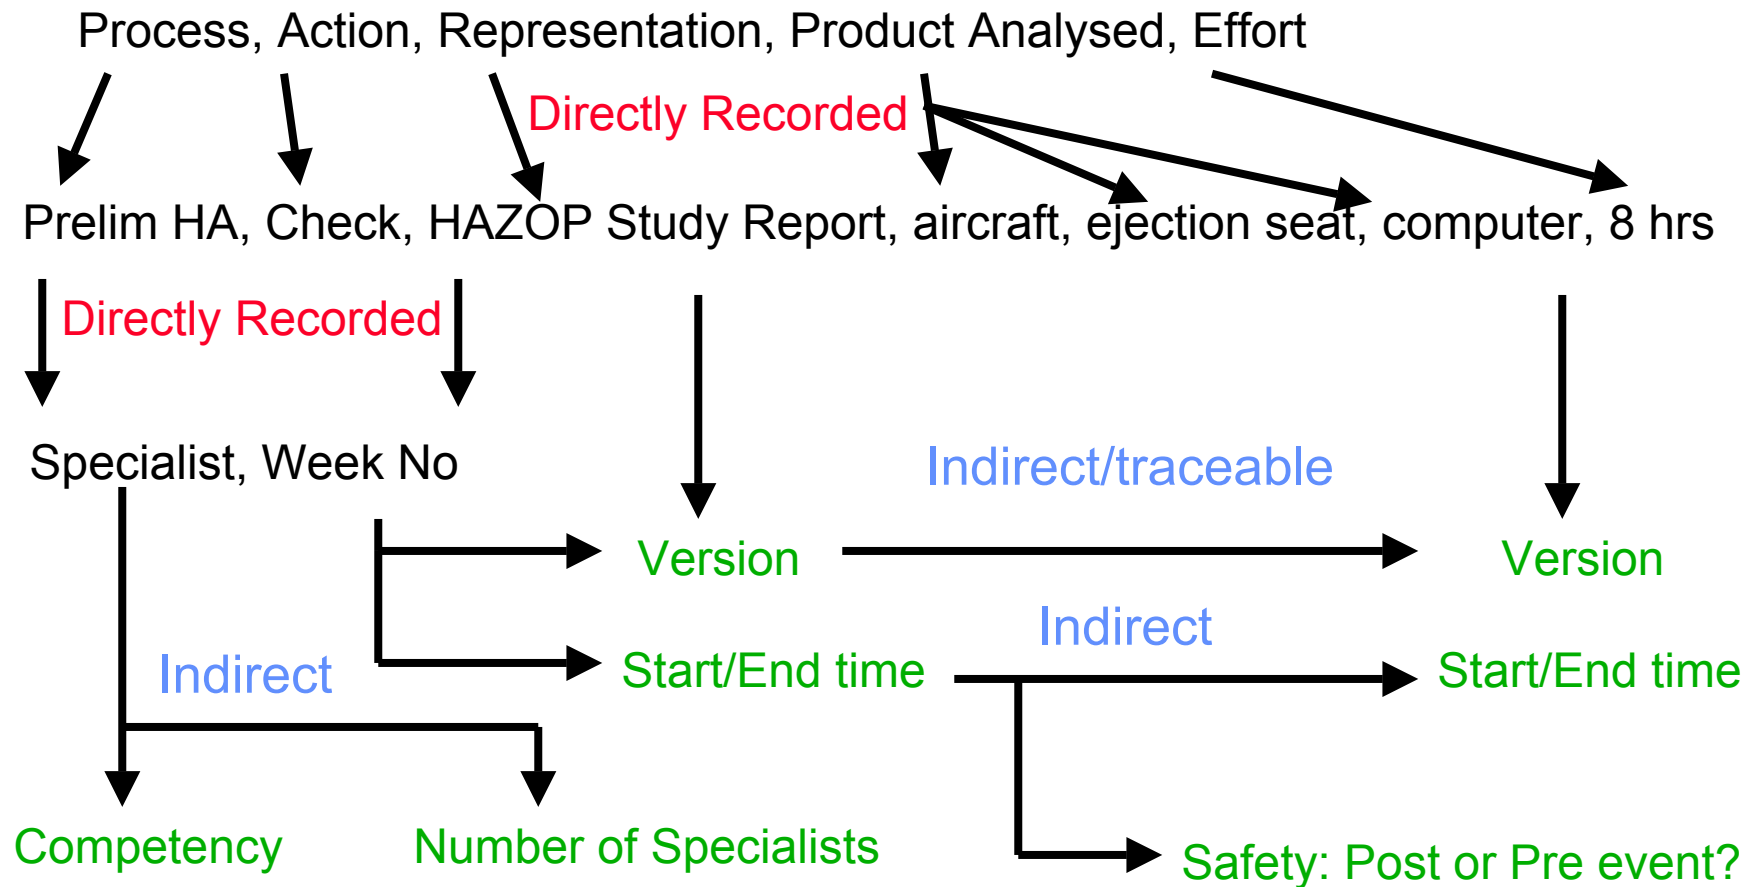

Practical Software and Systems Measurement

The SPEL Sub-Project

- ***Part of a MoD Corporate Research Programme***
 - ***Supporting Safety Process Measurement for ALARP***
 - ***2/3-year project between DSTL/MoD, QinetiQ, BAE SYSTEMS and University of York***
 - ***Overall aim is to provide a practical framework for measuring safety processes***
- ***Methods and Research***
 - ***Identify practical and useful safety process measurement attributes***
 - ***Use of Safety Process Engineering Language (SPEL) technique to capture fine-grained process measurements.***
 - ***Trials of SPEL on projects within QinetiQ, BAE SYSTEMS and trials within Rolls-Royce and Invensys to follow.***

Practical Software and Systems Measurement

SPEL Measurement Technique example

Practical Software and Systems Measurement

Example of SPEL collection

Simple pull down menus

SPEL statement

New Process

Task: Compliance → Action: Witness → Represented Object: Compliance Script

Analysed Object: Control System X1 → Sub-System: [dropdown menu]

Case Studies

- **Case Study 1 – MERLE on a control system**
 - *Aim: Experiment to discover if new static verification process is efficient and effective and practicable.*
 - **Context:**
 - *Additional assurance requested by customer*
 - *Developer willing and co-operative*
 - *MERLE claims to find potential runtime errors in source code*
 - *team size 2, project duration ~10 weeks, applied as a post development analysis*
 - **Process:** *definition of starting grammar for SPEL, refinement of grammar with the users of MERLE, data collection using spreadsheet tool, analysis and identification of potential improvement, presentation of results*

Practical Software and Systems Measurement

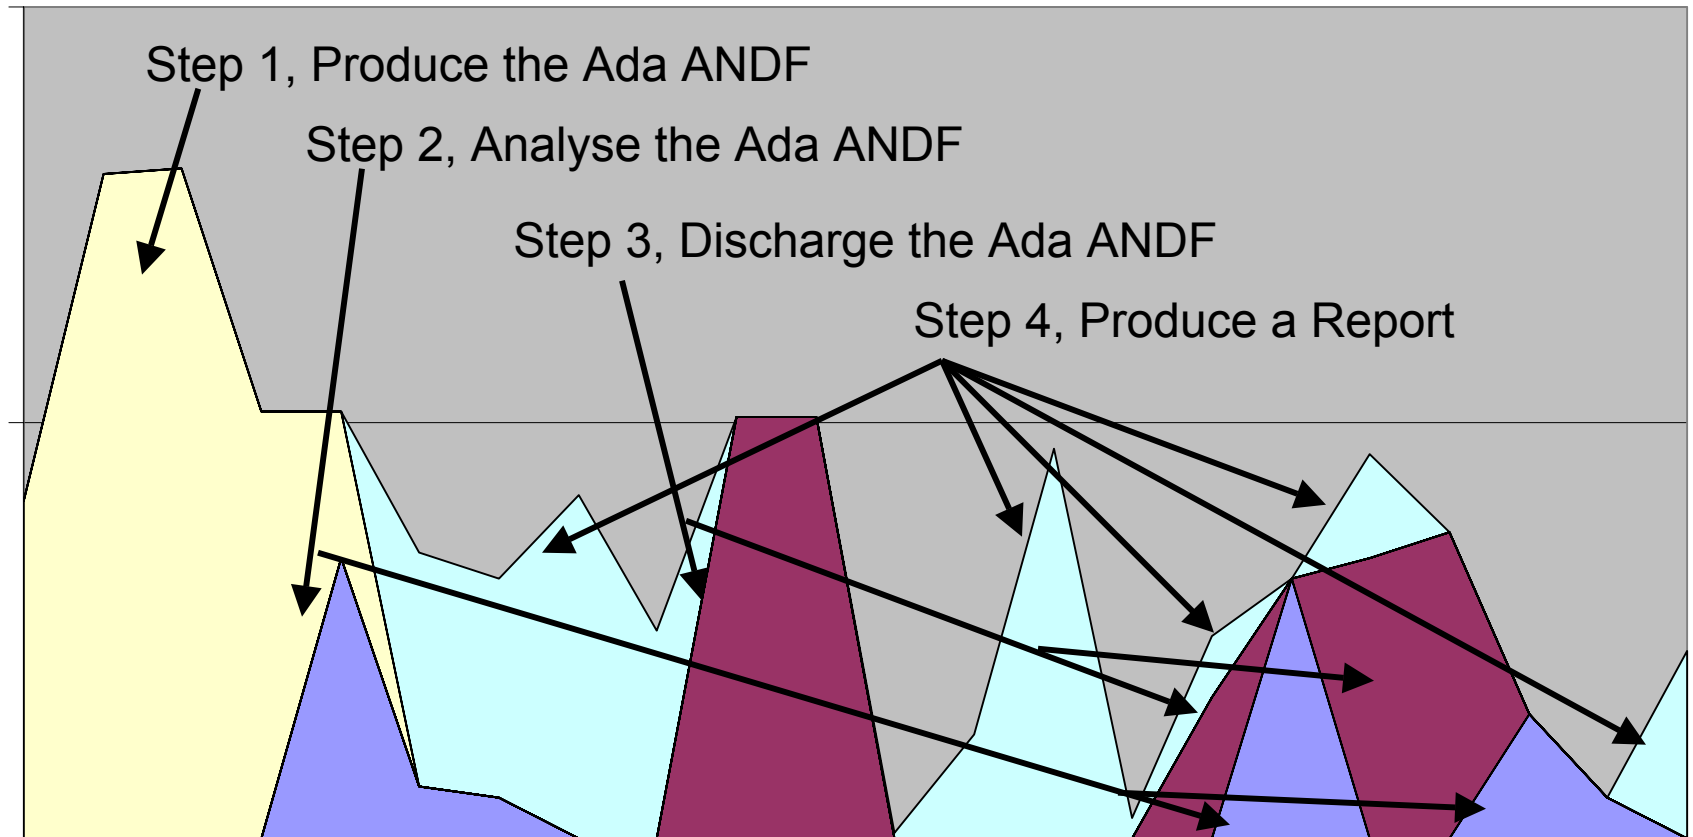

Large scale S/W development cycle

Practical Software and Systems Measurement

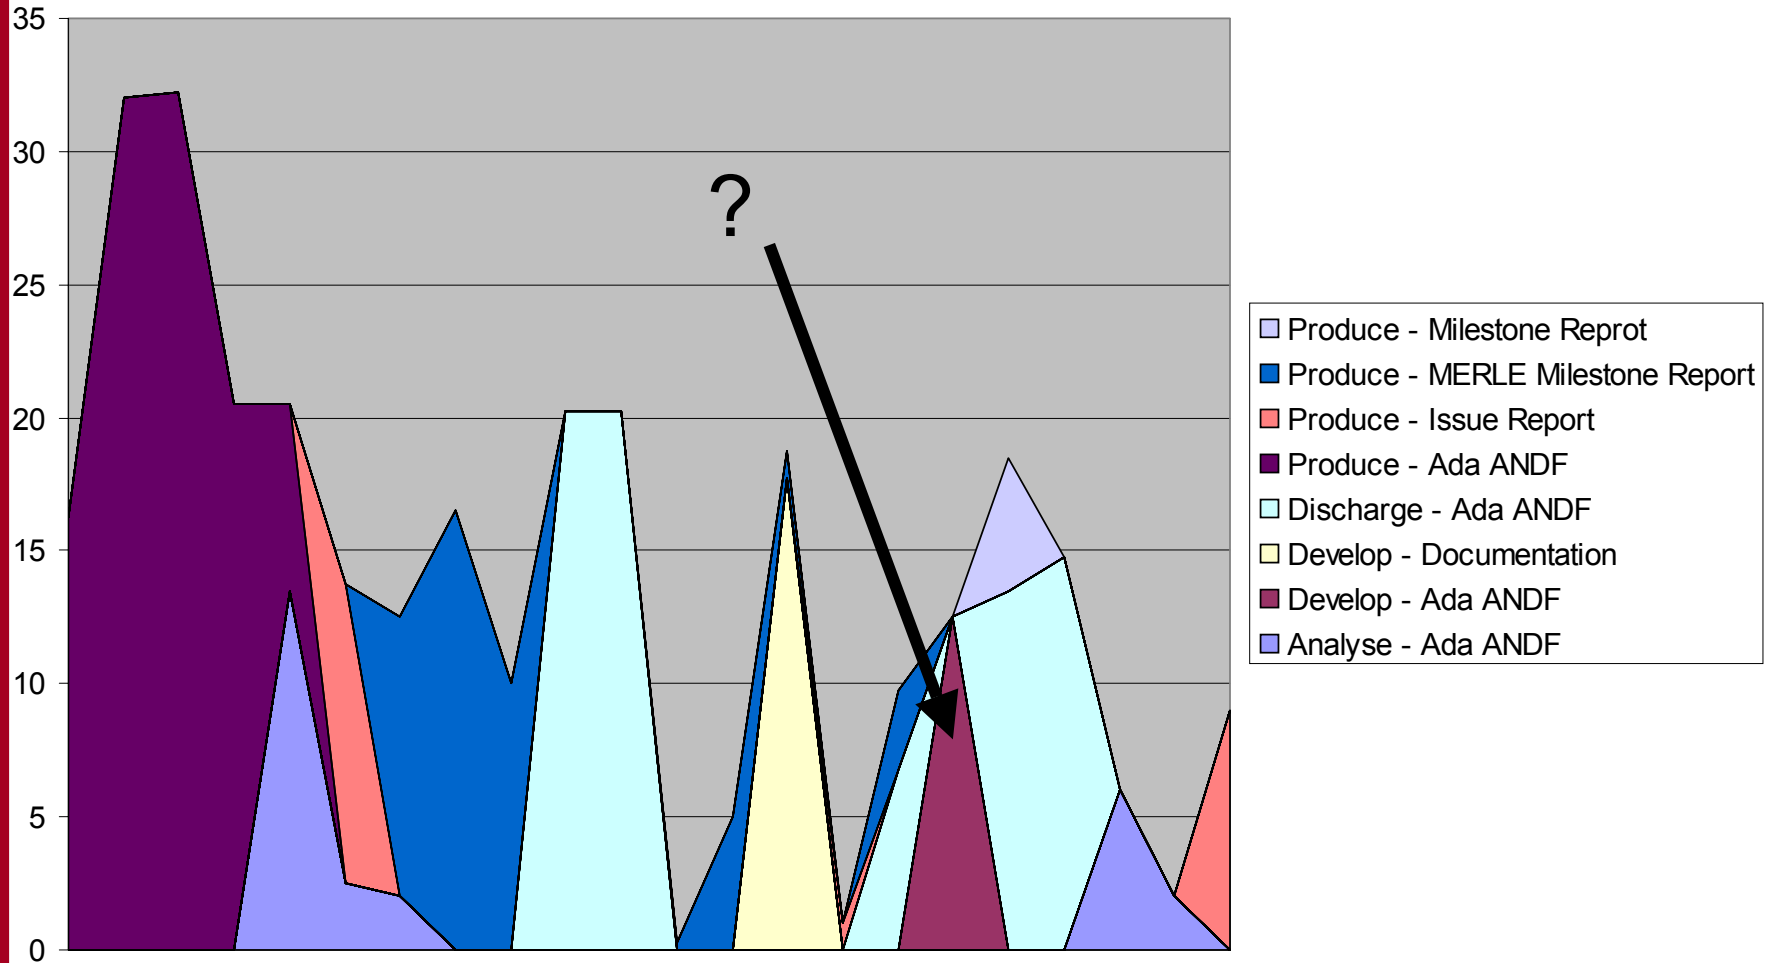

MERLE – Reconciled data on the Control System

Effort (hours)

Practical Software and Systems Measurement

MERLE: Action, Representation

Practical Software and Systems Measurement

MERLE – Some provisional figures

- Case 1

- Full process (per hour)

- ~1066 LOC

- ~377 SLOC

- ~108 BELOC

- per issue ~ 1.1

- Producing Warnings only

- ~2860 LOC

- ~1010 SLOC

- ~291 BELOC

- Producing and Discharge

PSM Safety 21 ~ 1400 LOC

- Case 2

- Full process (per hour)

- ~971 LOC

- ~331 SLOC

- ~110 – BELOC

- per issue ~ 2.6

- Producing Warnings only

- ~2264 LOC

- ~959 SLOC

- ~320 – BELOC

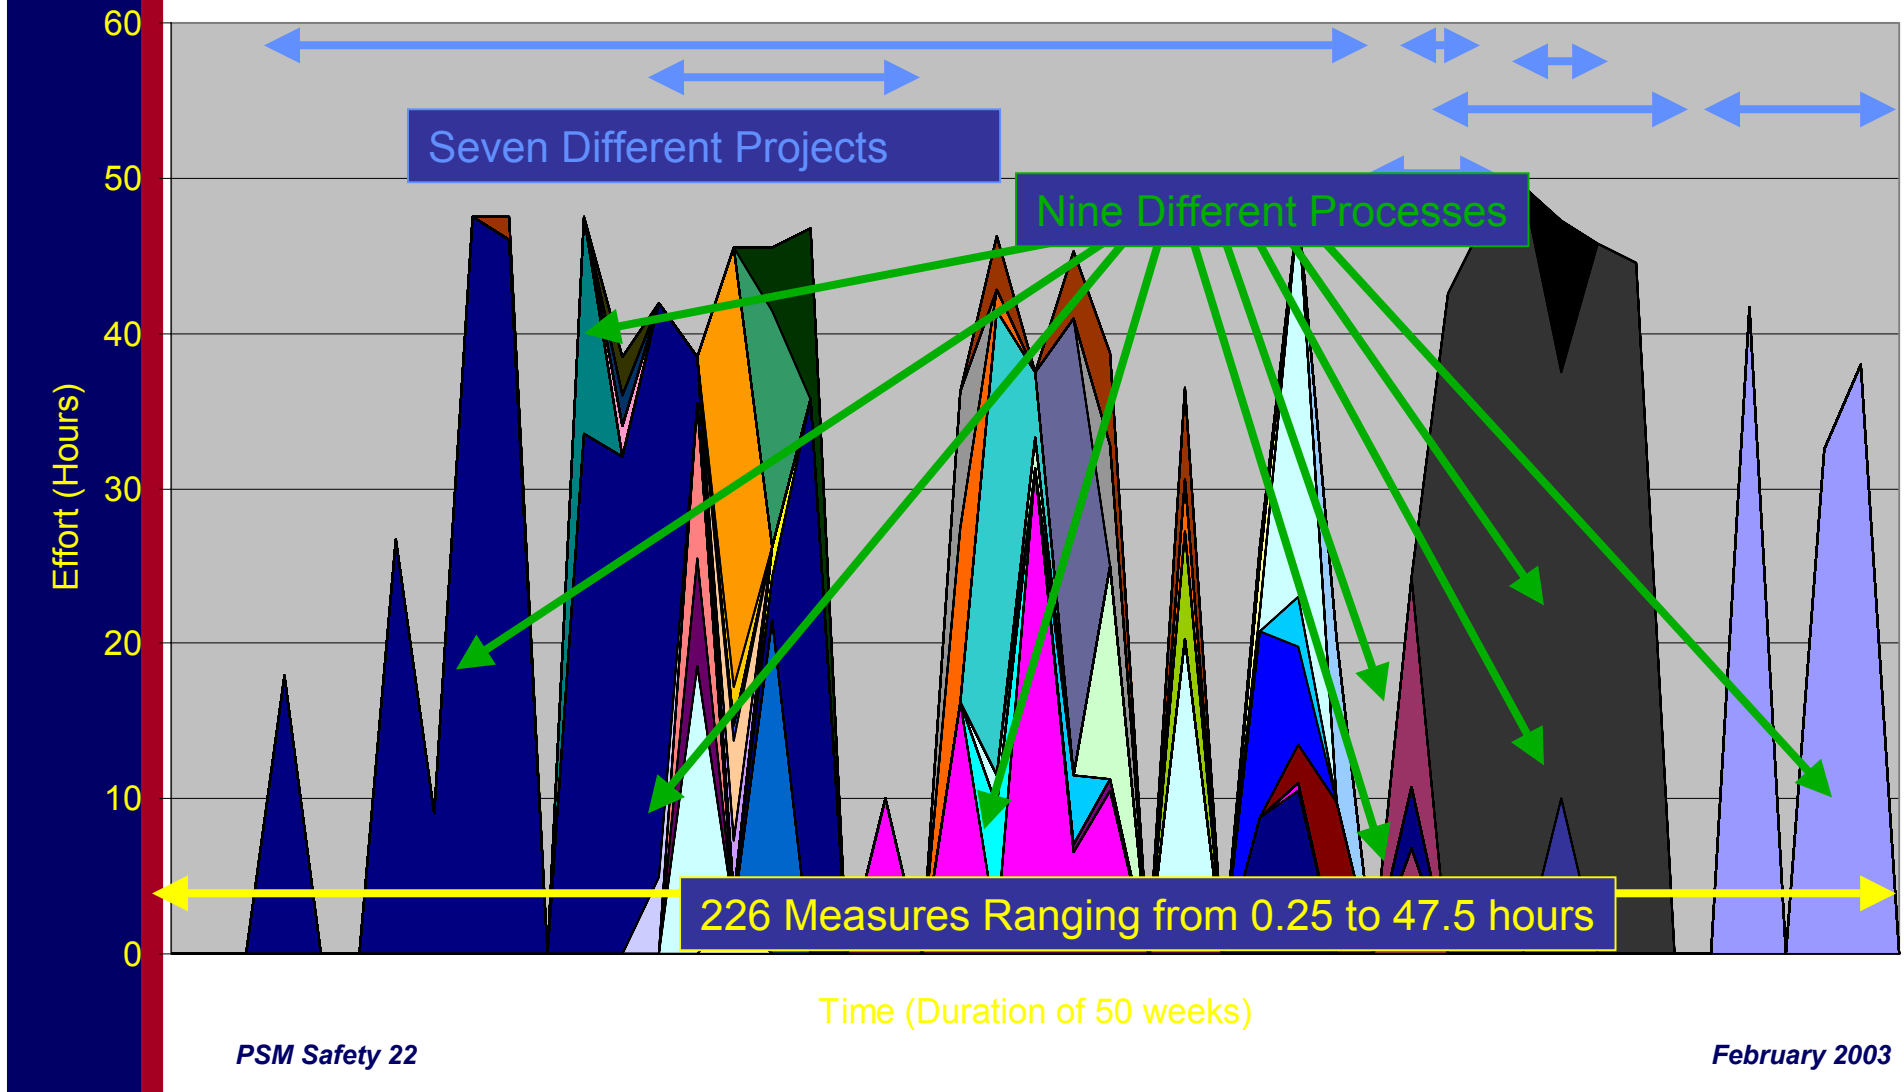

- Producing and Discharge

- ~1366 LOC

- ~466 SLOC

Practical Software and Systems Measurement

Example of an Individual

Practical Software and Systems Measurement

Insights

- ***Results and Observations***
 - ***Identification of overheads, predictive measures, effectiveness***
 - ***Improvements in novel processes for software verification***
 - ***Confirmation of anecdotal perspectives on safety processes***

- ***Implications***
 - ***Further refinement of terminology and collection approach.***
 - ***Ownership of measurement process passed back to team.***
 - ***New questions being asked about safety process and ALARP.***

Conclusions and Future Work

- ***Conclusions***
 - ***SPEL presents a promising way forward for measurement of fine-grained aspects of safety processes.***
 - ***Industrial trials are in their early stages but have already given examples of the value of fine-grained data in support of ALARP***
- ***Future Work***
 - ***Further trials are planned and participation of others is welcome.***
 - ***Linking SPEL approach into PSM and CMMI.***
